Licence

With the exception of the Commonwealth Coat of Arms and where otherwise noted, this product is provided under a Creative Commons Attribution 4.0 International Licence. (<http://creativecommons.org/licenses/by/4.0/legalcode>)

This licence lets you distribute, remix, tweak and build upon this work, even commercially, as long as they credit the *DTA* for the original creation. Except where otherwise noted, any reference to, reuse or distribution of part or all of this work must include the following attribution:

Trusted Digital Identity Framework (TDIF)[™] 06C SAML 2.0 Profile © Commonwealth of Australia (Digital Transformation Agency) 2021

Use of the Coat of Arms

The terms under which the Commonwealth Coat of Arms can be used are detailed on the It's an Honour website (<http://www.itsanhonour.gov.au>)

Conventions

References to *TDIF* documents, abbreviations and key terms (including the words *MUST*, *MUST NOT*, and *MAY*) are denoted in italics are to be interpreted as described in the current published version of the *TDIF: 01 – Glossary of Abbreviations and Terms*.

TDIF requirements and references to *Applicants* are to be read as also meaning *Accredited Providers*, and vice versa. The scope of *TDIF* requirements are to be read as applying to the identity system under *Accreditation* and not to the organisation's broader operating environment.

Contact us

The *DTA* is committed to providing web accessible content wherever possible. This document has undergone an accessibility check however, if you are having difficulties with accessing the document, or have questions or comments regarding the document please email digitalidentity@dta.gov.au

Document Management

The *DTA* has reviewed and endorsed this document for release.

Change log

Version	Date	Author	Description of the changes
0.01	Jan 18	BF	Initial version.
0.02	Aug 18	TM	Updates from stakeholder consultation.
1.0	Aug 18		Endorsed for release by the TDIF Accreditation Authority.
1.1	Sep 18	TM	Content updates.
1.2	Mar 19	SJP	Minor content updates to align with other TDIF documents.
1.3	Mar 20	AV	Update to be aligned with TDIF Release 4 work.
1.4	May 20		Published version
1.5	June 2021	JK	Template update

Document review

All changes made to the TDIF are published in the TDIF Change Log which is available at <https://www.digitalidentity.gov.au/privacy-and-security/trusted-digital-identity-framework>.

1 Introduction

This document sets out the Security Assertion Markup Language (*SAML*) 2.0 Profiles for the following interactions:

- Interactions between a *Relying Party* and an *Identity Exchange*.
- Interactions between an Identity Provider and an *Identity Exchange*.

The intended audience for this document includes:

- *Accredited Participants*.
- *Accredited Providers*
- *Applicants*.
- *Assessors*.
- *Relying Parties*.

2 Common profile requirements

2.1 Notation

- Conventional XML namespaces are used throughout the listings in this profile specification to stand for their respective namespaces as follows:
The prefix `saml:` stands for the SAML 2.0 assertion namespace, `urn:oasis:names:tc:SAML:2.0:assertion`.
- The prefix `samlp:` stands for the SAML 2.0 protocol namespace, `urn:oasis:names:tc:SAML:2.0:protocol`.
- The prefix `md:` stands for the SAML 2.0 metadata namespace, `urn:oasis:names:tc:SAML:2.0:metadata`.
- The prefix `mdattr:` stands for the Metadata Extension for Entity Attributes Version 1.0 namespace, `urn:oasis:names:tc:SAML:2.0:metadata:attribute`.

2.2 General

2.2.1 Clock skew

TDIF Req: SAML-02-02-01; **Updated:** Mar-20; **Applicability:** A, I, X

Implementations ***MUST*** allow for reasonable clock skew between systems when interpreting `xsd:dateTime` values and enforcing security policies based thereupon.

Items to which this directive apply include but are not limited to:

- `NotBefore`,
- `NotOnOrAfter`, and
- `validUntil`.

These attributes are found on the following elements:

- `Conditions`,
- `SubjectConfirmationData`,
- `LogoutRequest`,

- EntityDescriptor,
- EntitiesDescriptor,
- RoleDescriptor, and
- AffiliationDescriptor

Configurability is a suggested practice but tolerances of 3-5 minutes are considered reasonable defaults.

2.2.2 Data size

TDIF Req: SAML-02-02-02; **Updated:** Mar-20; **Applicability:** A, I, X

Where specific constraints are absent in the *SAML* standards or profile documents, *Applicant's* implementations *MUST* be able to accept without error or truncation, element and attribute values of type `xs:string` that are comprised of any combination of valid XML characters and containing up to 256 characters. This requirement applies to both user defined types and the types defined within the *SAML* standards such as transient and persistent `NameIDs`.

All data sizes and constraints are specified within *TDIF: - 06 Federation Onboarding Requirements*.

2.2.3 Document type definitions

TDIF Req: SAML-02-02-03; **Updated:** Mar-20; **Applicability:** A, I, X

Implementations *MUST NOT* send and *MUST* have the ability to reject *SAML* protocol messages containing a Document Type Definition (*DTD*).

2.3 Metadata and trust management

Although metadata is optional in the original *SAML 2.0* standards, it is now recognised that it is a critical component of all modern *SAML* software. To support a scalable federation model, implementations must adhere to the following procedures related to the exchange and validation of metadata.

2.3.1 Metadata Exchange

2.3.1.1 Metadata Acquisition Method

TDIF Req: SAML-02-03-01; **Updated:** Mar-20; **Applicability:** A, I, X

The *Applicant's* implementations MUST support the routine consumption of *SAML* metadata from a remote location via HTTP/1.1 [RFC 2616] on a scheduled or recurring basis with the contents applied automatically upon successful validation.

TDIF Req: SAML-02-03-02; **Updated:** Mar-20; **Applicability:** A, I, X

HTTP/1.1 redirects (status codes 301, 302, and 307) MUST be honoured by the *Applicant*.

TDIF Req: SAML-02-03-03; **Updated:** Mar-20; **Applicability:** A, I, X

The *Applicants* implementation MUST support the consumption of *SAML* metadata rooted in both `<md:EntityDescriptor>` and `<md:EntitiesDescriptor>` elements by this mechanism. Any number of child elements must be allowed for `<md:EntitiesDescriptor>`.

This method is less flexible and less efficient/scalable for larger metadata aggregates than the Metadata Query Protocol.

2.3.1.2 Metadata Query Protocol

TDIF Req: SAML-02-03-04; **Updated:** Mar-20; **Applicability:** A, I, X

The *Applicant* MAY support the acquisition of *SAML* metadata rooted in `<md:EntityDescriptor>` elements via the Metadata Query Protocol, defined in [SAML-MDQ] and [MDQ].

TDIF Req: SAML-02-03-05; **Updated:** Mar-20; **Applicability:** A, I, X

Applicant's Implementations that claim support for this protocol MUST be able to request and utilise metadata from one or more MDQ responders for any entity from which a *SAML* protocol message is received.

2.3.1.3 Validation

TDIF Req: SAML-02-03-06; **Updated:** Mar-20; **Applicability:** A, I, X

The *Applicant* MUST validate the authenticity and integrity of *SAML* metadata by verifying an enveloped XML signature attached to the root element of the metadata.

TDIF Req: SAML-02-03-07; **Updated:** Mar-20; **Applicability:** A, I, X

Public keys used for signature verification of the metadata MUST be configured out of band by the *Applicant*.

TDIF Req: SAML-02-03-08; **Updated:** Mar-20; **Applicability:** A, I, X

These keys MAY be contained by the *Applicant* within X.509 certificates but it MUST be possible to ignore the other content in the certificate and validate the XML Signature based on the public key.

TDIF Req: SAML-02-03-09; **Updated:** Mar-20; **Applicability:** A, I, X

It MUST be possible for the *Applicant* to limit the use of a trusted key to a single metadata source.

TDIF Req: SAML-02-03-10; **Updated:** Mar-20; **Applicability:** A, I, X

Applicant's Implementations MUST reject metadata if any one of the following conditions is true:

- The `validUntil` XML attribute on the root element is missing.
- The value of the `validUntil` XML attribute on the root element is a `xsd:dateTime` in the past.
- The value of the `validUntil` XML attribute on the root element is a `xsd:dateTime` too far into the future, where too far into the future is a configurable option.

Note: this requirement applies to the root element only. Any `validUntil` XML attributes in child elements MUST be processed in accordance with [SAML2Meta].

2.3.2 Metadata Usage

TDIF Req: SAML-02-03-11; **Updated:** Mar-20; **Applicability:** X

Applicant's Implementations **MUST** support SAML metadata as defined in the following OASIS specifications:

- SAML V2.0 Metadata [SAML2Meta] as updated by Errata [MetaAttr].
- SAML V2.0 Metadata Schema [SAML2MD-xsd].
- SAML V2.0 Metadata Interoperability Profile [SAML2MDIOP].
- SAML V2.0 Metadata Extension for Algorithm Support [SAML2MetaAlgSup].

TDIF Req: SAML-02-03-12; **Updated:** Mar-20; **Applicability:** A, I, X

Applicant's Implementations **MAY** support:

- SAML V2.0 Metadata Extension for Entity Attributes [MetaAttr].

TDIF Req: SAML-02-03-13; **Updated:** Mar-20; **Applicability:** X

Service Providers **MAY** support:

- SAML V2.0 Metadata Extensions for Login and Discovery User Interface [MetaUI].

The list above is not intended to be exhaustive but includes all material relevant to functionality required by these profiles.

TDIF Req: SAML-02-03-14; **Updated:** Mar-20; **Applicability:** A, I, X

In accordance with the Extensibility section 2.5 below, other metadata may be present and **MUST NOT** prevent the consumption and use of the metadata.

TDIF Req: SAML-02-03-15; **Updated:** Mar-20; **Applicability:** A, I, X

Applicant's Implementations **MUST** support the interpretation and application of metadata as defined by [SAML2MDIOP].

TDIF Req: SAML-02-03-16; **Updated:** Mar-20; **Applicability:** A, I, X

Applicant's Implementations **MUST** be able to interoperate with any number of SAML peers for which metadata is available without additional inputs or separate configuration.

This requirement does not preclude supporting a variety of configuration options on a peer to peer or other basis; it simply requires that the default behaviour be possible.

2.3.2.1 Key Rollover

TDIF Req: SAML-02-03-17; **Updated:** Mar-20; **Applicability:** A, I, X

Applicant's Implementations MUST have the ability to consume and make use of any number of signing keys bound to a single role descriptor in metadata.

TDIF Req: SAML-02-03-18; **Updated:** Mar-20; **Applicability:** A, I, X

When verifying digital signatures, *Applicant's* implementations MUST attempt to use each signing key until the signature is verified or there are no remaining keys and the signature verification is then deemed to have failed.

TDIF Req: SAML-02-03-19; **Updated:** Mar-20; **Applicability:** A, I, X

If an *Applicant's* implementation supports out bound encryption it MUST be able to consume any number of encryption keys bound to a single role descriptor in the metadata. If multiple encryption keys are specified any one of them may be used to encrypt outbound messages.

2.3.2.2 Algorithm Support

Migration from weak or broken algorithms deployed in production systems requires a coordinated update at a single point in time and is not feasible for large federations.

TDIF Req: SAML-02-03-20; **Updated:** Mar-20; **Applicability:** A, I, X

Applicant's implementations MUST be capable of publishing the cryptographic capabilities of their runtime configurations regarding XML Signature and Encryption. It is recommended that they support dynamic generation and export of this information and provide it in a machine readable format that can be included in metadata according to **[SAML2MetaAlgSup]**.

TDIF Req: SAML-02-03-21; **Updated:** Mar-20; **Applicability:** A, I, X

If a SAML peer has declared algorithm support according to **[SAML2MetaAlgSup]** in its metadata, SAML Identity Providers MUST and SAML Service Providers MAY limit the use of algorithms for XML Signature and Encryption to those declared in the messages they produce for that peer.

TDIF Req: SAML-02-03-22; **Updated:** Mar-20; **Applicability:** A, I, X

Applicant's implementations MAY be able to support the use of good and bad algorithms for some time to relax the schedule of updates. Implementations should select the most secure algorithm from those that are available.

2.3.2.3 Avoiding Common Errors

TDIF Req: SAML-02-03-23; **Updated:** Mar-20; **Applicability:** A, I, X

A `<md:KeyDescriptor>` element in metadata that contains no `use XML Attribute` MUST be valid as both a signing and encryption key. This is clarified in E62 of the SAML 2.0 Errata.

2.4 Web Browser SSO

TDIF Req: SAML-02-04-01; **Updated:** Mar-20; **Applicability:** A, I, X

Applicant's implementations MUST support the SAML 2.0 Web Browser SSO profile as defined in and as updated by [SAML2Errata].

TDIF Req: SAML-02-04-02; **Updated:** Mar-20; **Applicability:** I, X

SAML Identity Providers MUST support both the HTTP-Redirect and HTTP-POST bindings for authentication requests.

TDIF Req: SAML-02-04-03; **Updated:** Mar-20; **Applicability:** A, X

SAML Service Providers MUST support either the HTTP-Redirect and HTTP-POST bindings for authentication requests.

TDIF Req: SAML-02-04-04; **Updated:** Mar-20; **Applicability:** A, I, X

Applicant's implementations MUST support the signing of assertions and responses, both together and independently.

TDIF Req: SAML-02-04-05; **Updated:** Mar-20; **Applicability:** A, I, X

Applicant's implementations MUST support the following SAML 2.0 name identifier formats, in accordance with the normative obligations associated with them by [SAML2Core] section 8.3:

- `urn:oasis:names:tc:SAML:2.0:nameid-format:persistent`

TDIF Req: SAML-02-04-06; **Updated:** Mar-20; **Applicability:** A, I, X

Applicant's implementations MUST support the consumption of peer configuration values from *SAML* metadata, without additional inputs or separate configuration, for any metadata element that:

- Is identified as MUST or MAY in the “Use of Metadata” section for the Web Browser SSO Profile in [SAML2Prof] section 4.1.6; and corresponds to settings supported by the implementation.
- Unless specifically noted by subsequent requirements in this profile it is OPTIONAL for implementations to support the inclusion of optional elements and attributes in the protocol messages and assertions issued. It is REQUIRED that implementations successfully process messages and assertions containing any optional content they do not support i.e. this content must not result in errors or may be ignored, as directed by the processing rules for the element or attribute in [SAML2Core].

2.5 Extensibility

Support for extensibility allows deployments to evolve and meet future needs. The *SAML* standard has explicit support for extensibility in metadata, protocol messages, and assertions. Most extension points in *SAML* have optional semantics which means that ignoring extension content is valid and acceptable practice.

TDIF Req: SAML-02-05-01; **Updated:** Mar-20; **Applicability:** A, I, X

Applicant's implementations MUST successfully consume any well-formed extension. Unless otherwise noted in these profiles the content of `<samlp:Extension>`, `<md:Extensions>` and `<saml:Advice>` elements MAY be ignored but MUST NOT result in software failures.

TDIF Req: SAML-02-05-02; **Updated:** Mar-20; **Applicability:** A, I, X

Any element established in [SAML2MD-xsd] with a type definition containing an `xsd:anyAttribute` sub-element may include undefined attribute content. The *Applicant* MAY ignore this content but doing so MUST NOT result in software failures.

2.6 Authentication Context Class Reference

Assurance levels are defined in the *TDIF: 06 – Federation Onboarding Requirements*.

The TDIF Levels of Assurance are implemented in SAML using the standard Authentication Context Class Reference element as defined in [SAML2Core]. The `<saml:AuthnContextClassRef>` should be considered the same as the `acr` claim from OIDC when performing translation between the two protocols.

A single `acr` value can be requested by the *Relying Party* to specify the minimum level of assurance that is required by the *Relying Party*. The *Identity Exchange* interprets this as a request for any assurance level that meet or exceeds the requested level. The *Identity Exchange* will explicitly include all the `acr` values that will meet the requested minimum in the request it generates to the Identity Provider.

TDIF Req: SAML-02-06-01; **Updated:** Mar-20; **Applicability:** X

The Service Provider MAY request a single `<saml:AuthnContextClassRef>` that will meet the SPs minimum Identity and Credential requirements.

```
<samlp:RequestedAuthnContext Comparison="minimum">
  <saml:AuthnContextClassRef>
    urn:id.gov.au:tdif:acr:ip2:c13
  </saml:AuthnContextClassRef>
</samlp:RequestedAuthnContext>
```

TDIF Req: SAML-02-06-02; **Updated:** Mar-20; **Applicability:** I, X

The IdP MUST return the `<saml:AuthnContextClassRef>` that is the representation of the assurance levels that are defined in *TDIF: 06 – Federation Onboarding Requirements*.

```
<saml:AuthnStatement AuthnInstant="2017-07-17T01:01:48Z"
  SessionNotOnOrAfter="2017-07-17T09:01:48Z"
  SessionIndex="_be9967abd904ddcae3c0eb4189adbe3f71e327cf93">
  <saml:AuthnContext>
    <saml:AuthnContextClassRef>
      urn:id.gov.au:tdif:acr:ip2:c13
    </saml:AuthnContextClassRef>
  </saml:AuthnContext>
</saml:AuthnStatement>
```

The SP is required to determine if the `<saml:AuthnContextClassRef>` meets the minimum requirements for the authentication context that was specified.

3 Relying Party (SP) to Identity Exchange (IdP) Profile

3.1 Relying Party Profile (SP)

In this section all references to Service Provider or SP refer to the *Relying Party* and any references to Identity Provider or IdP refer to the Identity Exchange. Where the requirement is on a service provider the requirement is also placed on the Identity exchange to ensure that it is possible for the service provider to do the behaviour they are required to do.

3.1.1 Web Browser SSO

TDIF Req: SAML-03-01-01; **Updated:** Mar-20; **Applicability:** A, X

Service Providers ***MUST*** support the consumption of `<saml:Attribute>` elements containing any arbitrary `xs:string` value in the `Name` attribute and any arbitrary `xs:anyURI` value in the `NameFormat` attribute.

TDIF Req: SAML-03-01-02; **Updated:** Mar-20; **Applicability:** A, X

Service Providers ***MUST*** support the consumption of `<saml:AttributeValue>` elements containing any “simple” element content; that is, element content consisting only of text nodes, not mixed/complex content that may contain nested *XML* elements. It is **OPTIONAL** to support complex content.

There may be some future attributes defined within the TDIF that may require the Service Provider to support complex content.

TDIF Req: SAML-03-01-03; **Updated:** Mar-20; **Applicability:** A, X

Service providers ***MUST*** generate `<saml:AuthnRequest>` messages with a `<samlp:NameIDPolicy>` element with a `<samlp:NameIDPolicy>` Format of `urn:oasis:names:tc:SAML:2.0:nameid-format:persistent` and `AllowCreate` set to `true`.

TDIF Req: SAML-03-01-04; **Updated:** Mar-20; **Applicability:** A, X

Service Providers ***MUST*** support IdP discovery in accordance with [IdPDisco].

Note: this requirement only implies support for the simple redirection convention defined by that profile and does demand implementation of an actual discovery interface, though that is not precluded. Also note that the discovery mechanism should use *SAML* metadata to determine the endpoints to which requests are to be issued.

TDIF Req: SAML-03-01-05; **Updated:** Mar-20; **Applicability:** A, X

Service Providers **MUST** be capable of generating `<samlp:AuthnRequest>` messages with a `<samlp:RequestedAuthnContext>` element containing the exact comparison method and any number of `<samlp:AuthnContextClassRef>` elements as described in section 2.6 Authentication Context Class Reference.

TDIF Req: SAML-03-01-06; **Updated:** Mar-20; **Applicability:** A, X

When decrypting assertions, an attempt to use each decryption key **MUST** be made until the assertion is successfully decrypted or there are no more keys whereupon the decryption fails.

TDIF Req: SAML-03-01-07; **Updated:** Mar-20; **Applicability:** X

Service providers **MUST** support deep linking and maintain the direct accessibility of protected resources in the presence of Web Browser SSO.

TDIF Req: SAML-03-01-07a; **Updated:** Mar-20; **Applicability:** A, X

It **MUST** be possible to request an arbitrary protected resource and where the authorization permits, have it supplied as the result of a successful *SAML* SSO profile exchange.

TDIF Req: SAML-03-01-08; **Updated:** Mar-20; **Applicability:** A, X

Service Providers **MUST NOT** require the presence of the `xsi:type XML` attribute.

TDIF Req: SAML-03-01-09; **Updated:** Mar-20; **Applicability:** A, X

Service Providers **MAY** support the acceptance or rejection of assertion based on the content of the `<saml:AuthnContext>` element.

TDIF Req: SAML-03-01-10; **Updated:** Mar-20; **Applicability:** A, X

Service Providers **MAY** support decryption of `<saml:EncryptedAssertion>` elements. To fully support key rollover, Service Providers **MUST** be configurable with at least two decryption keys.

TDIF Req: SAML-03-01-11; **Updated:** Mar-20; **Applicability:** A, X

Service Providers MAY support the preservation of POST bodies across a successful SSO profile exchange, subject to size limitations dictated by policy or implementation constraints.

Note: the SAML binding-specific `RelayState` feature is typically used to maintain state required to satisfy both of these requirements. The exact details are left to implementations.

Support for unsolicited responses (IdP initiated SSO) is not a substitute for this requirement.

3.1.1.1 Avoiding Common Errors

TDIF Req: SAML-03-01-12; **Updated:** Mar-20; **Applicability:** A, X

Service Providers MUST NOT fail or reject responses due to the presence of unrecognised `<saml:Attribute>` elements.

TDIF Req: SAML-03-01-13; **Updated:** Mar-20; **Applicability:** A, X

Service Providers MUST NOT treat the `FriendlyName` attribute normatively or make comparisons based on its value.

TDIF Req: SAML-03-01-14; **Updated:** Mar-20; **Applicability:** A, X

Service Providers MUST NOT require that the name identifiers with a format of `urn:oasis:names:tc:SAML:2.0:nameid-format:persistent` to be overloaded with semantics or content beyond what is outlined in [SAML2Core] section 8.3.7.

Note: that if the name identifier format identifiers defined in [SAML2Core] are inapplicable to a given use case it should be possible for new ones to be established. Implementations not specific to a single deployment should support the use of arbitrary formats.

TDIF Req: SAML-03-01-15; **Updated:** Mar-20; **Applicability:** A, X

Service Providers MUST support the ability to reject unsigned `<samlp:Response>` elements and should do so by default.

Note: this requirement is intended to offer some protection against known attacks when XML Encryption is used with AES in CBC mode. While the use of AES-GCM is strongly preferred, requiring signed responses limits the potential range of attack sources to those with verifiable signatures.

3.2 Identity Exchange Profile (IdP)

3.2.1 Web Browser SSO

TDIF Req: SAML-03-02-01; **Updated:** Mar-20; **Applicability:** X

Identity Providers ***MUST*** support the generation of `<saml:Attribute>` elements containing any arbitrary `xs:string` value in the `Name` attribute and any arbitrary `xs:anyURI` value in the `NameFormat` attribute.

TDIF Req: SAML-03-02-02; **Updated:** Mar-20; **Applicability:** X

Identity Providers ***MUST*** be capable of determining whether or not to include specific SAML attributes or specific values in a response based on the `entityID` of the *Relying Party*.

TDIF Req: SAML-03-02-03; **Updated:** Mar-20; **Applicability:** X

Identity Providers ***MUST*** be capable of determining whether or not to include specific SAML attributes or specific values in a response based on the presence of `<mdattr:EntityAttributes>` extension elements [MetaAttr].

TDIF Req: SAML-03-02-04; **Updated:** Mar-20; **Applicability:** X

Identity Providers ***MUST*** be capable of determining whether or not to include specific SAML attributes or values in a response based on the presence of `<md:AttributeConsumingService>` elements (containing `<md:RequestedAttribute>` elements) found in metadata for a *Relying Party*, including the value of the enclosed `isRequired` XML attribute.

TDIF Req: SAML-03-02-05; **Updated:** Mar-20; **Applicability:** X

The Identity Provider ***MUST*** support the `AttributeConsumingServiceIndex` attribute in `<samlp:AuthnRequest>` messages as a means of determining the appropriate `<md:AttributeConsumingService>` element to process.

Note: `<md:RequestedAttribute>` elements in metadata can be used to help automate attribute release configurations in IdP deployments. An IdP could be configured to release attributes in metadata typically in combination with other criteria. Example criteria include the acquisition of user consent and/or the presence of a particular qualifying entity attribute for the *Relying Party*.

TDIF Req: SAML-03-02-05a; **Updated:** Mar-20; **Applicability:** X

Attributes released this way *MUST* only be released in accordance with the *Attribute Sharing Policies* set out in *TDIF: 06 – Federation Onboarding Requirements*.

TDIF Req: SAML-03-02-06; **Updated:** Mar-20; **Applicability:** X

Identity Providers *MUST* support the issuance of `<samlp:Response>` messages with the appropriate status code in the event of an error condition, provided the user agent remains available and an acceptable location to which to deliver the response is known. The criteria for “acceptability” of a response location are not formally specified but are subject to Identity Provider policy and reflect its responsibility to protect users from being sent to untrusted or possible malicious parties.

TDIF Req: SAML-03-02-07; **Updated:** Mar-20; **Applicability:** X

Identity Providers *MUST* support the `ForceAuthn` attribute in the `<samlp:AuthnRequest>` messages as defined in [SAML2Core].

TDIF Req: SAML-03-02-07a; **Updated:** Mar-20; **Applicability:** A, X

The authentication mechanism within an implementation *MUST* have access to the `ForceAuthn` indicator so that their behaviour may be influenced by its value.

Note: `ForceAuthn` is most commonly used for privilege escalation or to initiate explicit user approval for an action.

TDIF Req: SAML-03-02-08; **Updated:** Mar-20; **Applicability:** X

Identity Providers *MUST* support the `isPassive` attribute in `<samlp:AuthnRequest>` messages as defined in [SAML2Core].

TDIF Req: SAML-03-02-09; **Updated:** Mar-20; **Applicability:** X

Identity Providers *MUST* support the `<saml:RequestAuthnContext>` `exact` and `minimum` comparison method in `<samlp:AuthnRequest>` messages as defined in [SAML2Core].

TDIF Req: SAML-03-02-10; **Updated:** Mar-20; **Applicability:** X

Identity providers MAY support encryption of assertions. Support for encryption of identifiers and attributes is OPTIONAL.

TDIF Req: SAML-03-02-11; **Updated:** Mar-20; **Applicability:** X

Identity Providers MUST support the <samlp:NameIDPolicy> element in <samlp:AuthnRequest> messages as defined in [SAML2Core].

TDIF Req: SAML-03-02-12; **Updated:** Mar-20; **Applicability:** X

Identity Providers MUST support the AssertionConsumerServiceURL, ProtocolBinding, and AssertionConsumerServiceIndex attributes in <samlp:AuthnRequest> messages for the identification of the response endpoint and binding as defined in [SAML2Core].

4 Identity Exchange (SP) to Identity Provider (IdP) Profile

4.1 Identity Exchange Profile

In this section all references to Service Provider or SP refer to the Identity Exchange and any references to Identity Provider or IdP refer to the Identity Provider.

4.1.1 Web Browser SSO

TDIF Req: SAML-04-01-01; **Updated:** Mar-20; **Applicability:** X

Service Providers **MUST** support the consumption of `<saml:Attribute>` elements containing any arbitrary `xs:string` value in the Name attribute and any arbitrary `xs:anyURI` value in the NameFormat attribute.

TDIF Req: SAML-04-01-02; **Updated:** Mar-20; **Applicability:** X

Service Providers **MUST** support the consumption of `<saml:AttributeValue>` elements containing any “simple” element content; that is, element content consisting only of text nodes, not mixed/complex content that may contain nested XML elements. It is OPTIONAL to support complex content. Service Providers **MUST NOT** require the presence of the `xsi:type` XML attribute.

TDIF Req: SAML-04-01-03; **Updated:** Mar-20; **Applicability:** X

Service providers **MUST** be capable of generating, `<saml:AuthnRequest>` messages without a `<samlp:NameIDPolicy>` element and with a `<samlp:NameIDPolicy>` element but no Format attribute.

TDIF Req: SAML-04-01-04; **Updated:** Mar-20; **Applicability:** X

Service Providers **MUST** support IdP discovery in accordance with [IdPDisco].

Note: this requirement only implies support for the simple redirection convention defined by that profile and does demand implementation of an actual discovery interface, though that is not precluded. Also note that the discovery mechanism should use SAML metadata to determine the endpoints to which requests are to be issued.

TDIF Req: SAML-04-01-05; **Updated:** Mar-20; **Applicability:** X

Service providers MUST support the processing of responses from any number of issuing IdPs for any given resource URL. It MUST NOT be a restriction of an implementation that multiple IdPs can only be supported by requiring distinct resource URLs for each IdP. The ability to satisfy this requirement should come naturally from the ability to support [IdPDisco].

TDIF Req: SAML-04-01-06; **Updated:** Mar-20; **Applicability:** X

Service Providers MUST be capable of generating `<samlp:AuthnRequest>` messages with a `<samlp:RequestedAuthnContext>` element containing the exact comparison method and any number of `<samlp:AuthnContextClassRef>` elements.

TDIF Req: SAML-04-01-07; **Updated:** Mar-20; **Applicability:** X

Service Providers MUST support the acceptance or rejection of assertion based on the content of the `<saml:AuthnContext>` element.

TDIF Req: SAML-04-01-08; **Updated:** Mar-20; **Applicability:** X

Service Providers MUST support decryption of `<saml:EncryptedAssertion>` elements.

TDIF Req: SAML-04-01-09; **Updated:** Mar-20; **Applicability:** X

To fully support key rollover, Service Providers MUST be configurable with at least two decryption keys.

TDIF Req: SAML-04-01-09a; **Updated:** Mar-20; **Applicability:** I, X

When decrypting assertions, an attempt to use each decryption key MUST be made until the assertion is successfully decrypted or there are no more keys whereupon the decryption fails.

Support for unsolicited responses (IdP initiated SSO) is not a substitute for this requirement.

4.1.1.1 Avoiding Common Errors

TDIF Req: SAML-04-01-10; **Updated:** Mar-20; **Applicability:** X

Service Providers **MUST** support the ability to reject unsigned `<samlp:Response>` elements and should do so by default.

Note: this requirement is intended to offer some protection against known attacks when XML Encryption is used with AES in CBC mode. While the use of AES-GCM is strongly preferred, requiring signed responses limits the potential range of attack sources to those with verifiable signatures.

TDIF Req: SAML-04-01-11; **Updated:** Mar-20; **Applicability:** X

Service Providers **MUST NOT** fail or reject responses due to the presence of unrecognised `<saml:Attribute>` elements.

TDIF Req: SAML-04-01-12; **Updated:** Mar-20; **Applicability:** X

Service Providers **MUST NOT** treat the `FriendlyName` attribute normatively or made comparisons based on its value.

TDIF Req: SAML-04-01-13; **Updated:** Mar-20; **Applicability:** X

Service Providers **MUST NOT** require that the name identifiers with a format of `urn:oasis:names:tc:SAML:2.0:nameid-format:persistent` be overloaded with semantics or content beyond what is outlined in [SAML2Core] section 8.3.7.

Note: that if the name identifier format identifiers defined in [SAML2Core] are inapplicable to a given use case it should be possible for new ones to be established. Implementations not specific to a single deployment should support the use of arbitrary formats.

4.2 Identity Provider Profile (IdP)

In this section all references to Service Provider or SP refer to the Identity Exchange and any references to Identity Provider or IdP refer to the Identity Provider.

4.2.1 Web Browser SSO

TDIF Req: SAML-04-02-01; **Updated:** Mar-20; **Applicability:** I

Identity Providers ***MUST*** support the generation of `<saml:Attribute>` elements containing any arbitrary `xs:string` value in the `Name` attribute and any arbitrary `xs:anyURI` value in the `NameFormat` attribute.

TDIF Req: SAML-04-02-02; **Updated:** Mar-20; **Applicability:** I

Identity Providers ***MUST*** be capable of determining whether or not to include specific SAML attributes or specific values in a response based on the `entityID` of the *Relying Party*.

TDIF Req: SAML-04-02-03; **Updated:** Mar-20; **Applicability:** I

Identity Providers ***MUST*** be capable of determining whether or not to include specific SAML attributes or specific values in a response based on the presence of `<mdattr:EntityAttributes>` extension elements [MetaAttr].

TDIF Req: SAML-04-02-04; **Updated:** Mar-20; **Applicability:** I

Identity Providers ***MUST*** be capable of determining whether or not to include specific SAML attributes or values in a response based on the presence of `<md:AttributeConsumingService>` elements (containing `<md:RequestedAttribute>` elements) found in metadata for a *Relying Party*, including the value of the enclosed `isRequired` XML attribute.

TDIF Req: SAML-04-02-05; **Updated:** Mar-20; **Applicability:** I

The Identity Provider ***MUST*** support the `AttributeConsumingServiceIndex` attribute in `<samlp:AuthnRequest>` messages as a means of determining the appropriate `<md:AttributeConsumingService>` element to process.

Note: `<md:RequestedAttribute>` elements in metadata can be used to help automate attribute release configurations in IdP deployments. An IdP could be configured to release attributes in metadata typically in combination with other criteria. Example criteria include the acquisition of user consent and/or the presence of a particular qualifying entity attribute for the *Relying Party*.

TDIF Req: SAML-04-02-06; **Updated:** Mar-20; **Applicability:** I

Identity Providers **MUST** support the issuance of `<samlp:Response>` messages with the appropriate status code in the event of an error condition, provided the user agent remains available and an acceptable location to which to deliver the response is known. The criteria for “acceptability” of a response location are not formally specified but are subject to Identity Provider policy and reflect its responsibility to protect users from being sent to untrusted or possible malicious parties.

TDIF Req: SAML-04-02-07; **Updated:** Mar-20; **Applicability:** I

Identity Providers **MUST** support the `ForceAuthn` attribute in the `<samlp:AuthnRequest>` messages as defined in [SAML2Core].

TDIF Req: SAML-04-02-08; **Updated:** Mar-20; **Applicability:** I

The authentication mechanism within an implementation **MUST** have access to the `ForceAuthn` indicator so that their behaviour may be influenced by its value.

Note: `ForceAuthn` is most commonly used for privilege escalation or to initiate explicit user approval for an action.

TDIF Req: SAML-04-02-09; **Updated:** Mar-20; **Applicability:** I

Identity Providers **MUST** support the `isPassive` attribute in `<samlp:AuthnRequest>` messages as defined in **[SAML2Core]**.

TDIF Req: SAML-04-02-10; **Updated:** Mar-20; **Applicability:** I

Identity Providers **MUST** support the `<saml:RequestAuthnContext>` exact comparison method in `<samlp:AuthnRequest>` messages as defined in [SAML2Core].

TDIF Req: SAML-04-02-11; **Updated:** Mar-20; **Applicability:** I

Identity providers **MUST** support encryption of assertions. Support for encryption of identifiers and attributes is OPTIONAL.

TDIF Req: SAML-04-02-12; **Updated:** Mar-20; **Applicability:** I

Identity Providers **MUST** support the `<samlp:NameIDPolicy>` element in `<samlp:AuthnRequest>` messages as defined in [SAML2Core].

TDIF Req: SAML-04-02-13; **Updated:** Mar-20; **Applicability:** I

Identity Providers ***MUST*** be capable of generating `<saml:Assertion>` elements without a `<saml:NameID>` element in the `<saml:Subject>` element.

TDIF Req: SAML-04-02-14; **Updated:** Mar-20; **Applicability:** I

Identity Providers ***MUST*** support the `AssertionConsumerServiceURL`, `ProtocolBinding`, and `AssertionConsumerServiceIndex` attributes in `<samlp:AuthnRequest>` messages for the identification of the response endpoint and binding as defined in [SAML2Core].

5 Attributes

Attributes supported as part of the federation are described in *TDIF: 06D – Attribute Profile*.

As part of the establishment of the federation, the attributes required by the *Relying Party*, whether this is an SP talking to an Identity Exchange or an Identity Exchange talking to an Identity Provider require that the user consents and agrees to these attributes being passed through the federation. These agreed attributes will be returned as part of the `<saml:AttributeStatement>` returned in the `<samlp:Response>`.

```
<saml:AttributeStatement>
  <saml:Attribute Name="family_name"
    NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:basic">
    <saml:AttributeValue xsi:type="xs:string">
      Michaels
    </saml:AttributeValue>
  </saml:Attribute>
  <saml:Attribute Name="given_name"
    NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:basic">
    <saml:AttributeValue xsi:type="xs:string">
      Stephen
    </saml:AttributeValue>
  </saml:Attribute>
  <saml:Attribute Name="birthdate"
    NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:basic">
    <saml:AttributeValue xsi:type="xs:string">
      1974-02-29
    </saml:AttributeValue>
  </saml:Attribute>
</saml:AttributeStatement>
```

TDIF Req: SAML-05-01-01; **Updated:** Mar-20; **Applicability:** A, I, X

Attributes MAY be requested as part of the SAML Authentication Request. These attributes are requested through the Extension element.

TDIF Req: SAML-05-01-02; **Updated:** Mar-20; **Applicability:** A, I, X

The Sender and the Recipient of the request MAY agree to the semantics of data sent this way.

An example of the Extension element with a request for attributes is shown in the non-normative example below:

```
<samlp:AuthnRequest>
  . . . .
  <samlp:Extensions>
```

```

<Attribute name="family_name">
  <Value></Value>
</Attribute>
<Attribute name="given_name">
  <Value></Value>
</Attribute>
<Attribute name="email">
  <Value></Value>
</Attribute>
<Attribute name="audit_id">
  <Value></Value>
</Attribute>
</samlp:Extensions>
. . . .
</samlp:AuthnRequest>

```

5.1.1 SAML Attribute Mapping

There is no concept of a scope in SAML 2.0.

In general, attributes are included in *SAML* 2.0 assertion about a subject in an `<AttributeStatement>` that contains an `<Attribute>` element for each attribute. See Section 2.7.3.1 of the *SAML* core specification [SAMLCore]. The following rules applies for the attributes returned as `<Attribute>` elements:

- The NameFormat *XML* attribute in `<Attribute>` elements *MUST* have the value `urn:oasis:names:tc:SAML:2.0:attrname-format:uri`.
- A value of the *XML* attribute FriendlyName is provided for each of the *SAML* 2.0 attributes in this profile. This only defined for the purposes of readability, it is optional, and it plays no role in processing.
- The *XML* schema type of the contents of the `<AttributeValue>` must be drawn from one of the types defined Section 3 of [**Schema2**]. The `xsi:type` must be present and given the appropriate value.

The Authentication Time attributes uses the standard *SAML* `AuthnInstant` attribute in authentication responses. The time value is encoded in UTC. See Section 2.7.2 of the *SAML* core specification [SAMLCore].

TDIF Req: SAML-05-01-03; **Updated:** Mar-20; **Applicability:** I, X

When making or responding to a request using the *SAML* 2.0 Federation Protocol the *Applicant* *MUST* use the mapping of the attributes to the protocols specified in section 4.2.2 of the *TDIF: 06D – Attribute Profile*.

5.1.1.1 Mapping complex objects to SAML attributes

It is difficult to map complex objects to *SAML* attributes in a way that can be guaranteed to be interoperable with Relying Parties as many implementations can only handle elements that contain simple *XML* types, not nested *XML* elements.

Where the object is multi-valued, but each value is a simple *XML* type, then multiple `<AttributeValue>` elements are to be used for each value. An example is shown below:

JSON example:

```
"example_attr": [
  "value1",
  "value2"
]
```

SAML equivalent:

```
<saml:Attribute
NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:uri"
Name="urn.id.gov.au:tdif:example_attr" FriendlyName="example_attr">
  <saml:AttributeValue xsi:type="xs:string">value1</saml:AttributeValue>
  <saml:AttributeValue xsi:type="xs:string">value2</saml:AttributeValue>
</saml:Attribute>
```

TDIF Req: SAML-05-01-04; **Updated:** Mar-20; **Applicability:** A, I, X

The following approach ***MUST*** be used for complex objects that have nested elements:

- Where there is at most one instance of the complex object, then the contents of the complex object may be flattened into separate *SAML* attributes where the name of the attribute is qualified with xml namespace that is the extension namespace for TDIF attributes. See an example of this approach at <http://www.simplecloud.info/specs/draft-scim-saml2-binding-02.html#anchor5>
- Where there is one or more instances of the complex object then the *JSON* representation of the component object as defined by this specification may be included as the `<AttributeValue>` element as a *XML* string.

These approaches are illustrated in the following examples:

JSON example:

```
"example_attr": {
  "attr1": "value1",
  "attr2": {
    "childattr1": "value2"
  }
}
```

SAML Equivalent using flattened attributes.

```
<saml:AttributeStatement
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  xmlns:saml="urn:oasis:names:tc:SAML:2.0:assertion"
  xmlns:tdif="urn:id.gov.au:tdif">
  <saml:Attribute NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-
format:unspecified" Name="TDIF.example_attr.attr1">
    <saml:AttributeValue xmlns:xsi="http://www.w3.org/2001/XMLSchema-
instance" xsi:type="xs:string">value1</saml:AttributeValue>
  </saml:Attribute>
  <saml:Attribute NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-
format:unspecified" Name="TDIF.example_attr.attr2.childattr1">
    <saml:AttributeValue xmlns:xsi="http://www.w3.org/2001/XMLSchema-
instance" xsi:type="xs:string">value2</saml:AttributeValue>
  </saml:Attribute>
</saml:AttributeStatement>
```

SAML Equivalent using embedded JSON object as a string. Not that the string must be encoded so that XML special characters are escaped.

```
<saml:Attribute
NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:uri"
Name="urn:id.gov.au:tdif:example_attr" FriendlyName="example_attr">
  <saml:AttributeValue
xsi:type="xs:string">{"attr1": "value1", "attr2": {"childattr1": "value2"}}</saml:AttributeValue>
</saml:Attribute>
```

6 Acknowledgements

The authors of this document acknowledge the work of the Kantara Initiative, see <https://kantarainitiative.org/>, a non-profit based organisation passionate about giving control of data back to people. The Kantara Initiative Inc. provides real-world innovation and specifications and conformity assessment programs for the digital identity and personal data ecosystems.

To maximise the interoperability of this profile, applicable elements from the SAML V2.0 Implementation Profile for Federation Interoperability Version 1.0 (working draft) have been used. The Kantara Federation Interoperability Work Group is developing this profile, the home page for this working group can be found at <https://kantarainitiative.org/confluence/display/fiwig/Home>.

Annex A – Interactions

The following sequence diagrams show the logical sequence of interactions for the authentication of a user.

Figure 1 – User Authentication Sequence Diagrams (steps 1 to 5)

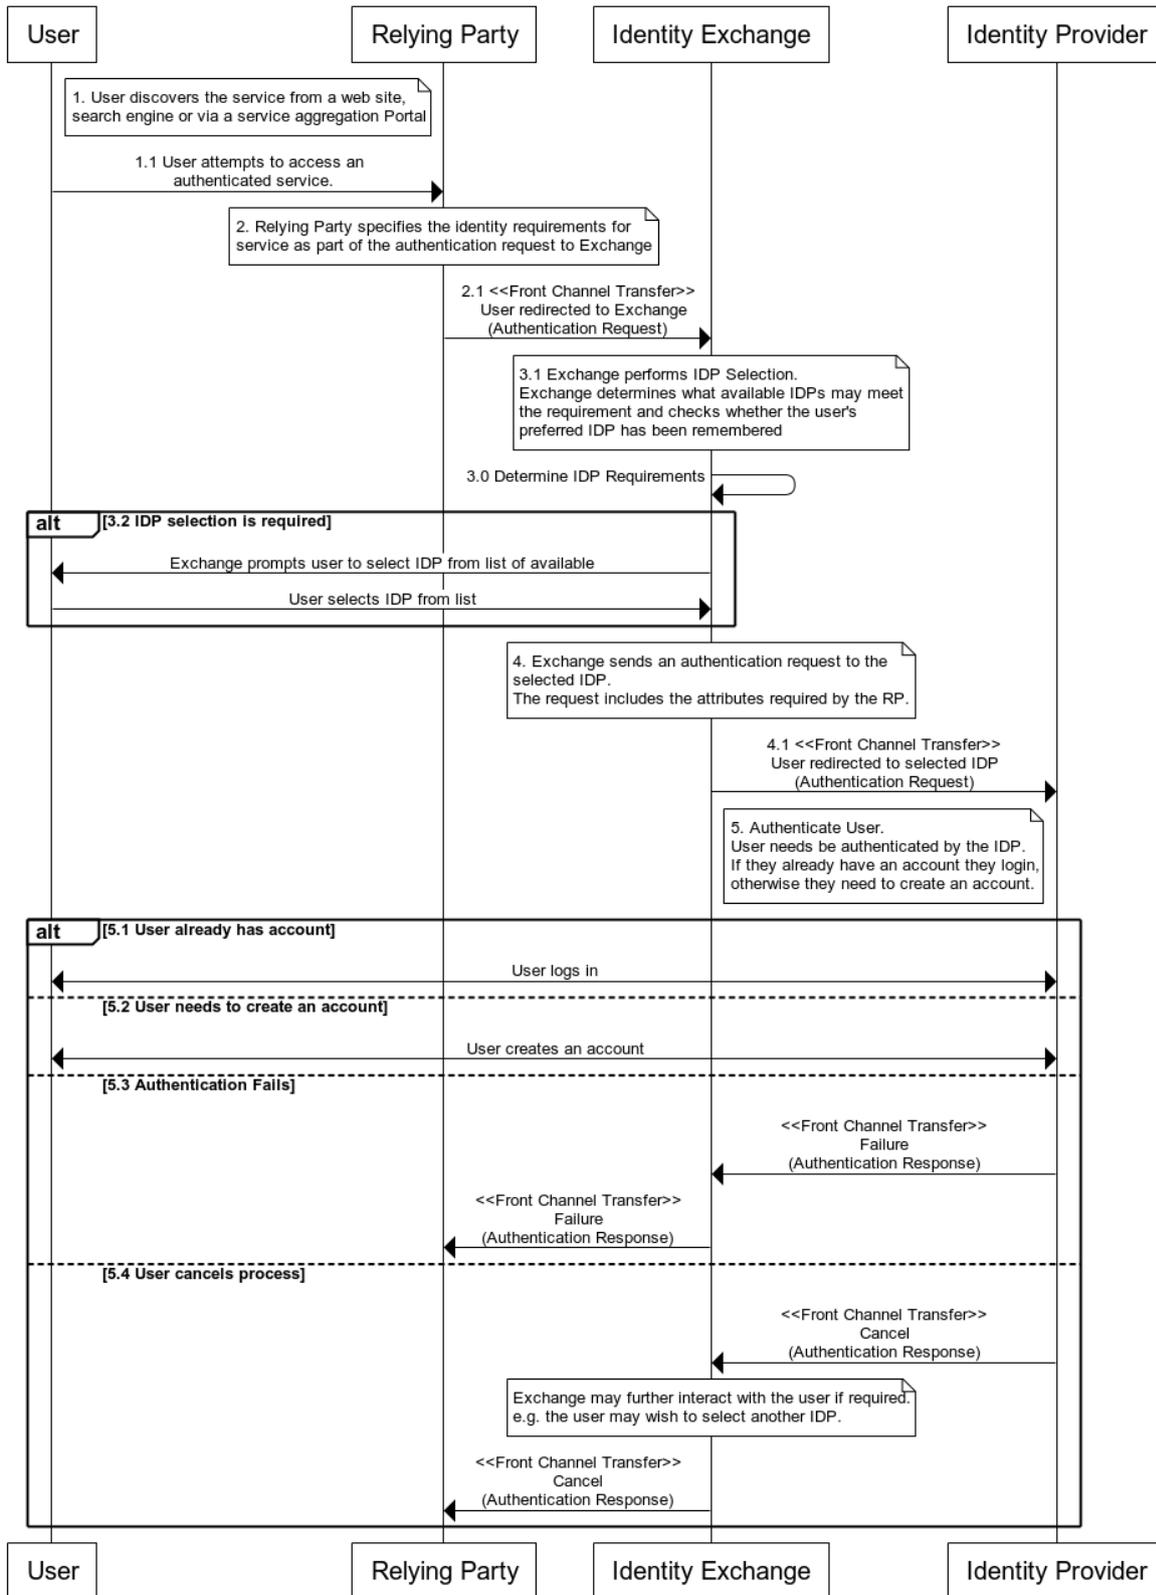

Figure 2 – User Authentication (steps 6 to 11)

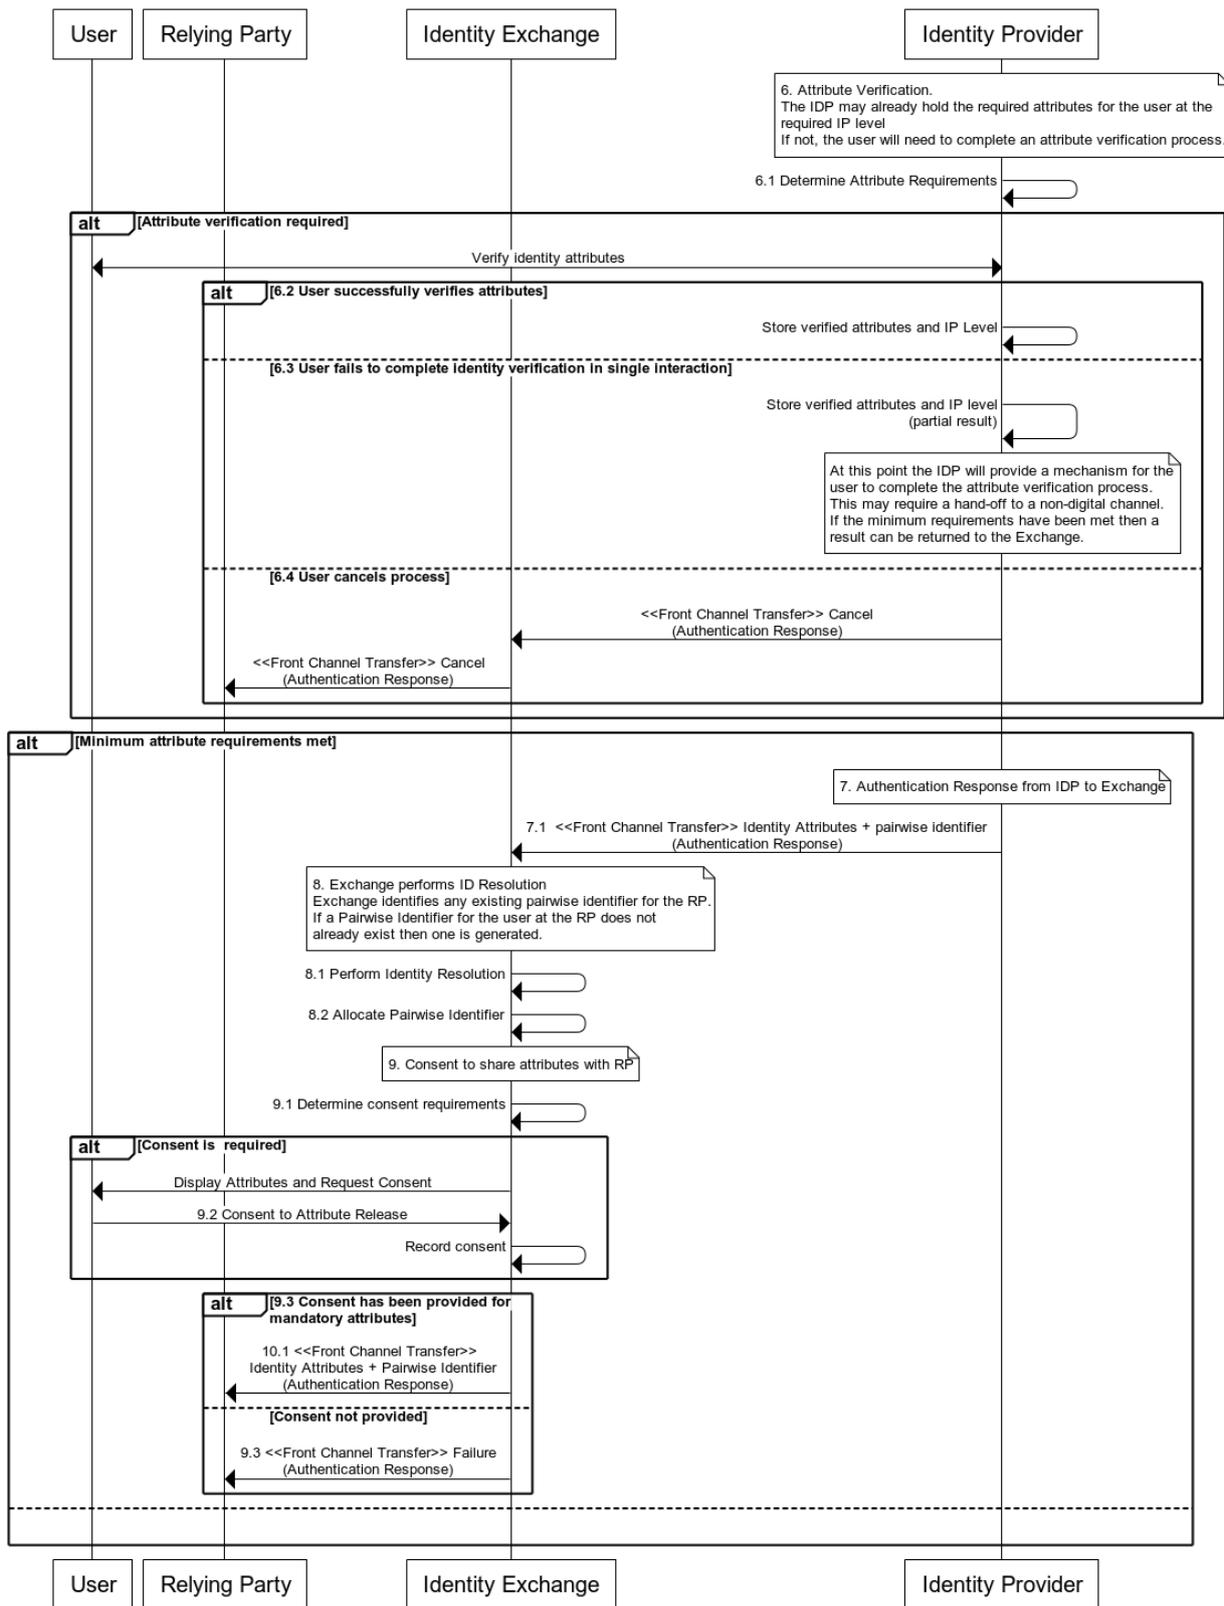

Figure 1 and 2 are sequence diagrams show the sequence of logical interactions for the authentication of a user. These interactions are intended to illustrate the

application of the *SAML* profiles described in this document to an end-to-end user experience. Where the user is transferred between entities via the user agent, e.g. web browser, the interaction is annotated with the <<Front Channel Transfer>> label. Each step in the diagram is described in detail below. Each step in the diagram is described in detail below.

1. User discovers the digital service.

1.1. User attempts to access an authenticated digital service.

- The user discovers the digital service at a *Relying Party*. This may be from content on unauthenticated web site, a search engine, or from within a service aggregation portal.
- The user accessing the service triggers the authentication process and verification of identity attributes may occur as part of this authentication process.
- A user may initiate the attribute verification process independently of accessing a service by going directly to an Identity Provider.

2. Authentication Request from *Relying Party* to Exchange.

2.1. User redirected to Exchange by the *Relying Party* using an authentication request.

- The *Relying Party* specifies the identity requirements for the digital service as part of the authentication request. The request includes the required TDIF Assurance Levels and required identity attributes.
- The *Relying Party* specifies the minimum assurance level that is required. The minimum assurance level may be specified as mandatory. If the specified minimum IP level is mandatory it must be reached for a successful authentication response to be returned to the *Relying Party*.
- The identity attributes may be specified as optional or mandatory. If a mandatory attribute cannot be returned (not available or consent not provided) then the authentication response will be a failure.

Step 2 uses the *Relying Party* to Identity Exchange Profile:

- A *SAML* Authentication Request from *Relying Party* is sent to the Identity Exchange. The Request includes:

- required identity attributes either as extensions in the request or pre-determined via the *Relying Party's* metadata.
- <AuthnContextClassRef> values that specify the required assurance levels.

3. Identity Provider Selection.

3.1. The Identity Exchange determines the Identity Providers that will meet the requirements of the Authentication Request from the *Relying Party*. The Identity Exchange will determine what Identity Providers are available to meet the request. It will also check when a preferred Identity Provider for the user has been remembered.

3.2. If more than one Identity Provider is available then the user will be prompted to select an Identity Provider from a list. This selection may be remembered to streamline further interactions.

3.3. User Cancels Process. An Authentication Response indicating the cancellation of the process is sent back to the *Relying Party*.

4. Authentication Request from Identity Exchange to Identity Provider.

4.1. Exchange redirects the user to the selected Identity Provider using an authentication request. The request includes the attributes and assurance levels that were originally requested by the *Relying Party*.

Step 4 uses the Identity Exchange to Identity Provider Profile.

- A *SAML* Authentication Request is sent to the Identity Provider. The request includes:
- the attributes that are required to service the *Relying Party* request either as extensions in the authentication request or predetermined via the Identity Exchanges metadata.
- the set of <AuthnContextClassRef> values that meet or exceed the <AuthnContextClassRef> requested by the *Relying Party*.

5. Authenticate User. The user will either login to an existing account at the Identity Provider or create a new one.

5.1. User already has an account at the Identity Provider.

- The user logs into the Identity Provider using their existing credentials. If the existing credentials do not meet the required credential level the user will need to enrol additional credentials.

5.2. User does not have an account at the Identity Provider.

- The user creates an account and is issued with credentials at the required credential level.

5.3. Authentication Fails.

- If the user fails to authenticate at the required credential level then an Authentication Response indicating the authentication failure is sent back to the Identity Exchange. The Identity Exchange then sends the same Authentication Response back to the *Relying Party*.

5.4. User Cancels Process.

- An Authentication Response indicating the cancellation of the process is sent back to the Exchange. The Exchange may interact with the user to determine if an alternate pathway is required to complete the process, e.g. to select a different Identity Provider. The Identity Exchange then sends the same Authentication Response back to the *Relying Party* if there is no identified alternate pathway.

Step 5 uses the Identity Exchange to Identity Provider Profile.

- Authentication Fails: IDP responds with the defined error status corresponding to the failure.
- User Cancels Process: IDP responds with the defined error status that the error was on the part of the responder with the following second-level status code: `urn:id.gov.au:tdif:SAML:2.0.status.AuthnCancelled`.

Step 5 then continues using the *Relying Party* to Identity Exchange Profile.

- Authentication Fails: Exchange responds with the error status that was received from the IdP.

- User Cancels Process: IDP responds with error code value that was received from the IdP.
6. Verify Attributes. The Identity Provider may already hold the attributes at the required IP level for the user. If not, an interaction with user is required to verify attributes at the required level.
- 6.1. Identity Provider determines attribute requirements.
- The Identity Provider checks the attributes already held for the user and determine if any further attribute verification is required. If attribute verification is required then steps 6.2 to 6.4 are possible paths.
- 6.2. User successfully verifies attributes.
- The user is able to successfully verify attributes at the required level.
- 6.3. The user is unable to complete the attribute verification process to the desired IP level in a single digital interaction.
- The Identity Provider will store the partial result and provide a process for the user to complete the attribute verification. This may require a hand-off to a non-digital channel. If the *Relying Party* originally specified a minimum IP level that has been met then a response can be returned to the *Relying Party*, otherwise this sequence of interactions end here.
- 6.4. User Cancels Process.
- An Authentication Response indicating the cancellation of the process is sent back to the Exchange. The Identity Exchange then sends the same Authentication Response back to the *Relying Party* if there is no identified alternate pathway.

Step 6 uses the Identity Exchange to Identity Provider Profile.

- User Cancels Process: IDP responds with the defined error status that the error was on the part of the responder with the following second-level status code: `urn:id.gov.au:tdif:SAML:2.0.status.AuthnCancelled`.

- Authentication Response to Exchange: If the minimum attribute requirements are met then a successful authentication response is sent back to the Exchange.

7. Authentication Response is sent back to the Identity Exchange.

7.1. The Authentication Response from the Identity Provider includes:

- Achieved `<AuthnContextClassRef>` level.
- A pairwise identifier for the user at the Identity Provider.
- Identity attributes.

Step 7 uses the Identity Exchange to Identity Provider Profile.

- A *SAML* Response is returned to the Identity Exchange containing the identity attributes defined from either the request or from the Identity Exchanges metadata within an Attribute Statement and the achieved `<AuthnContextClassRef>` level. The Response is signed with the Identity Provider's Private key.

8. Exchange performs Identity Resolution.

- Identity Exchange identifies any existing pairwise identifier user at the *Relying Party*. If a pairwise Identifier for the user at the *Relying Party* does not already exist then one is generated.

8.1. Perform Identity Resolution.

- If a pairwise identifier is already mapped to the pairwise identifier from the Identity Provider then the Identity Exchange will use the pairwise identifier that is already allocated for the user.

8.2. Allocate Pairwise Identifier.

- If required, a pairwise identifier is generated for the user. A pairwise identifier is an anonymous, unique identifier for the user at the *Relying Party*.

9. Consent to share attributes.

9.1. Determine consent requirements.

- Identity Exchange determines the user consent requirements for the attributes requested by the *Relying Party*. It will include checking for any enduring consent for sharing the attributes with the *Relying Party*.

9.2. Consent to Attribute Release.

- If user consent is required, the Identity Exchange will interact with the user to gather consent to release the attributes to the *Relying Party*. The Identity Exchange will record the provided consent and the user's preference for enduring this consent.

9.3. Consent not provided.

- If user consent is not provided for any mandatory attribute then a failure Authentication Response is returned to the *Relying Party*.

Step 9.3 uses the *Relying Party* to Identity Exchange Profile:

- Consent not provided (mandatory attribute): Exchange responds with the defined error status that the error was on the part of the requestor.

10. Authentication Response to *Relying Party*.

10.1. Authentication Response is sent back to the *Relying Party*.

- The Response includes:
 - Achieved `<AuthnContextClassRef>` level.
 - Pairwise identifier for user at the *Relying Party*.
 - Identity attributes for which consent has been provided.

Step 10 uses the *Relying Party* to Identity Exchange Profile.

- A *SAML* Response is returned to the *Relying Party* containing the identity attributes defined from either the request or from the Identity Exchanges metadata within an Attribute Statement and the achieved `<AuthnContextClassRef>` level. The Response is signed with the Identity Provider's Private key.

11. User accesses digital service.

11.1. *Relying Party* uses the identity attributes to enable the user to access the digital service.

- The first time the user accesses the first the *Relying Party* may need to determine if there is an existing customer record by using the identity attributes as part of an Identity Matching process. Once a customer record has been located or created at the *Relying Party* the Pairwise identifier is stored by the *Relying Party*, subsequent interaction by the user with the digital service will simply use the pairwise identifier to locate the customer record.
- Note: some transactions may be one-off and not require the above process.

Annex B – Worked Examples

The following example shows successful authentication interactions between a *Relying Party* (RP) and an Identity Provider (IdP) via an Identity Exchange using the Web SSO Profile using the HTTP-POST binding.

HTTP POST Binding

1. The End User requests access to a protected resource without a security context. The *Relying Party* determines the location of an endpoint for an Identity Exchange.
2. The *Relying Party* sends an HTML form back to the browser with a *SAML* request for authentication from the Identity Exchange.
3. The form is automatically posted to the Identity Exchange's SSO service.
4. The authentication request includes the name of the *Relying Party* requesting the authentication (ProviderName) and the `<samlp:AuthenticationContextClassRef>` to specify the required level of assurance.

The following is a non-normative example of the SAML Authentication request (with line wraps with shortened cryptographic element values and line wraps for readability).

```
<samlp:AuthnRequest xmlns:samlp="urn:oasis:names:tc:SAML:2.0:protocol"
  xmlns:saml="urn:oasis:names:tc:SAML:2.0:assertion"

</samlp:AuthnRequest>

```

5. The Identity Exchange validates the Authentication Request from the *Relying Party*.
6. The identity Exchange prompts the End User to select an Identity Provider (account). The Identity Exchange may provide a mechanism to remember a previous Identity Provider selection made by the End User.
7. The Identity Exchange then constructs a *SAML* Request for Authentication from the selected Identity Provider and sends it back to the End User's browser.
8. This request is automatically posted to the Identity Providers SSO service.
9. The authentication request includes the name of the Identity Exchange as the name of the *Relying Party* requesting the authentication and the same `<samlp:AuthenticationContextClassRef>` value that was requested in the authentication request from the *Relying Party*.

The following is a non-normative example of the *SAML* Authentication request (with line wraps with shortened cryptographic element values and line wraps for readability).

```
<samlp:AuthnRequest xmlns:samlp="urn:oasis:names:tc:SAML:2.0:protocol"

</samlp:AuthnRequest>
```

10. The Identity Provider validates the request.

11. The Identity Provider verifies if the End User is logged in and logs them if they aren't ensuring that any additional requirements are met to meet the requirements of the `<RequestedAuthnContext>`. If the End User was already logged in and their existing Authentication Context is lower than the `<RequestedAuthnContext>` they will be required to perform any additional interaction required to meet the requested `<RequestedAuthnContext>`.
12. After the successful authentication the Identity Provider builds a SAML Response including the retrieval of any attributes that have been predetermined to be required as part of the federation agreement between the Identity Exchange and the Identity Provider and the achieved `<saml:authnContextClassRef>`.
13. The SAML Response is sent back to the End User's browser and automatically posted to the Identity Exchange's Assertion Consumer Service (ACS). Note that the response is signed as per the requirements of SAML for *POST* responses.

The following is a non-normative example of the SAML Response (with line wraps with shortened cryptographic element values and line wraps for readability).

```
